Offering High Quality Native and Exotic Perennials

Echinacea 'Burgundy Starburst'

This NEW and unique coneflower is the culmination of five generations of breeding over ten years, and combines three different coneflower species: *Echinacea laevigata*, *E. purpurea*, and *E. tennesseensis*.

Most unique about this selection is the deep burgundy to beet red ray flowers, which are not only upturned like its *E. tennesseensis* ancestor, but are individually fused into quills. The plant when covered with its 3 1/2 inch wide flower heads can best be described as perky! This selection is long-blooming as well. No other coneflower has this combination of traits. Hardy for four years of field evaluation and stable through three cycles of tissue culture propagation. USDA Zones 5 to 7 at least. Developed by Dr. Jim Ault at the Chicago Botanic Garden in Glencoe, Illinois.
